The natural logarithm has a base of e . e is approximately 2.718. The number e was discovered by a great 18th century mathematician named Euler. This famous irrational number is useful for determining rates of growth and decay. equal x . It is written $\log_b x$. In algebraic terms this means that if $y = \log_b x$ then $x = b^y$ by The formula $y = \log_b x$ is said to be written in logarithmic form and $x = b^y$ is said to be written in exponential form.
